

Plant Name	Scientific	Common	Family	Date Reviewed 03/24/20
Echinacea tenesseeensis		Tennessee purple coneflower	Asteraceae	
Propagation Method		Native to		
Seed		Tennessee USA		
Treatments (Suggested procedures)				
Plants germinate well after 14 day cold moist stratification followed by germination in a heated greenhouse between 70 days and 55 nights.				
Collection Timing and Strategies				
Seed ripens in August. This plant is quite difficult to clean. A hammermill to free seed from seed heads is almost a must have item. Seeds within the flowerhead matures at quite different times. The best seed is a light tan color and is cone shaped rather than flat.				
Cultural Information				
Greenhouse conditions				
Once seedlings have been transplanted they can be moved to a 70 - 40 greenhouse. Allow plants to dry between waterings				
Garden conditions				
Plant in a sunny location with good east facing exposure as flowers always face that direction.
