

Plant Name	Scientific	Common	Family	Date Reviewed 03/24/20
Jamesia americana		Waxflower	Hydrangeaceae	
Propagation Method		Native to		
Seed, Cuttings		Western United States. Utah and Colorado's mountain canyons of pinyon-juniper woodlands at 4,000'-10,000'.		
Treatments (Suggested procedures s				
Fresh seed germinates readily with no pre-treatments. Do not cover seed as they require light to germinate. Softwood cuttings are possible if there is no seed supply.				
Collection Timing and Strategies				
Seed set is in August - November. Seed dehisce rapidly, so carefull monitoring of plants is necessary if you are collecting your own.				
Cultural Information				
Greenhouse conditions				
Once seed have germinated keep seedlings on the dry side to avoid damping off and rot.				
Garden conditions				
Plants grow best in rapidly draining soils with regular irrigation. If grown in soils that retain moisture then plants should be grown xeric.				
Other Expert Advice				
Seed of previous years can be germinated with a 120-180 day cold stratification.
