

Plant Name	Scientific	Common	Family
Muhlenbergia reverchonii (Ogden selection)		UNDAUNTED® ruby muhly	Poaceae
Propagation Method		Native to	
Seed or division		US: OK, TX	
Treatments (Suggested procedures)			
<p>Seed--From seed, <i>Muhlenbergia reverchonii</i> germinates best with a very light scarification. It is recommended that the seed be rubbed between a fine grain sandpaper to scar the seed coat, not completely remove. Seed should be sown 2-3 per cell and will germinate within 10-14 days. Division--Plants divide very easily from plants in the ground or from potted stock plants. Three or four blades supported by a root system is sufficient to start a new plant.</p>			
Collection Timing and Strategies			
Seed must be collected very ripe in order to be viable; check for a darker gray/brown embryo when deciding when to collect. In some climates, <i>M. reverchonii</i> will not bloom until late September-October; this may not provide enough time for fully-formed seed to develop.			
Cultural Information			
Greenhouse conditions			
<i>M. reverchonii</i> can tolerate temperature swings from 45F to 90F in pots and it has low water requirements.			
Garden conditions			
<i>M. reverchonii</i> can tolerate a wide range of soils and temperatures including cold hardiness.
