

Plant Name	Scientific	Common	Family	Date Reviewed 03/24/20
PENSTEMON barbatus 'Coral Baby'		Coral Baby penstemon	Plantaginaceae	
Propagation Method		Native to		
Vegetative				
Treatments (Suggested procedures)				
<p>Tip cuttings root easily in approximately 7 - 10 days. We use an IBA rooting hormone at 500 ppm to aid in rooting. Keep moist during propagation by mist or by covering with light row cloth.</p>				
Collection Timing and Strategies				
Cuttings should be taken from non flowering shoots while plant is actively growing.				
Cultural Information				
Greenhouse conditions				
Cuttings root well in a 70° greenhouse. Reduce temperature and moisture as plants root in.				
Garden conditions				
Plant in full sun and in a well-drained soil.				
Other Expert Advice				
Keep blooms off to maintain a vegetative state for propagation.
