

Plant Name	Scientific	Common	Family	Date Reviewed 03/24/20
Penstemon rostriflorus		Bridge's Penstemon	Plantaginaceae	
Propagation Method		Native To		
Cutting or seed		South-Western U.S., Colorado, Utah, Nevada, New Mexico, Arizona, California.		
Treatments (Suggested procedures)				
Seed needs either a 30 day cold stratification or a one hour soak in 200 ppm GA3. Seeds can be covered but it is not necessary. Cuttings can be rooted under mist or with row cover and hand watering. A 1:10 dip in a liquid rooting hormone is suggested.				
Collection Timing and Strategies				
Cuttings should be taken from non-flowering stems and should be about two inches in length.				
Cultural Information				
Greenhouse conditions				
Plants should be grown drier than traditional crops. Shearing will produce fuller plants for sales.				
Garden conditions				
Plants prefer full sun but can tolerate part shade, they also prefer a dry or well drained soil.				
Other expert Advice				
Susceptible to Pythium.
