

Plant Name	Scientific	Common	Family	Date Reviewed 03/24/20
Tanacetum cinerariifolium		Dalmatian daisy	Asteraceae	
Propagation Method		Native to		
Seed		Dalmatia and Eastern Europe		
Treatments (Suggested procedures)				
Grow plants from seed. In DBG trials the best germination was at 70 days and no covering to the seed. Seed takes about 10 days to start germination and can take 6 weeks to be large enough to transplant.				
Collection Timing and Strategies				
Seed should be collected in Sept or Oct when plants are mature. Asteraceous species can be very difficult to clean and process due to the high numbers of non viable empty seed.				
Cultural Information				
Greenhouse conditions				
Plants can be susceptible to damping off and should be allowed to dry between watering and grown where there is good air circulation.				
Garden conditions				
Best grown in full sun in well draining soil.				
Other Expert Advice				
Weekly 100ppm Zero-Tol drench helps keep down on damping off. Plants at DBG grown in moderate shade became stretched and needed to be pruned before going out to the gardens.
