

Plant Name	Scientific	Common	Family
------------	------------	--------	--------

<i>Digitalis obscura</i>		Sunset® Foxglove	Scrophulariaceae
--------------------------	--	------------------	------------------

Propagation Method	Native to
--------------------	-----------

Seed or cutting	Spain
-----------------	-------

Treatments (Suggested procedures)

Typically germinates in 8 - 14 days. Plants germinate at a higher rate when not covered. No preconditioning of seed is required. Cuttings taken from non-flowering stems will root with a mild hormonal treatment and with mist for the first 3 - 5 days. Root initiation can take up to 4 weeks.

Collection Timing and Strategies

Terminal and internodal cuttings can be taken from new shoot growth throughout the growing season.

Cultural Information

Greenhouse conditions

Susceptible to damping off if kept too wet.

Garden conditions

Plant in well drained soil. Grows best in partial shade.

Other Expert Advice

Gibberellic acid will increase the rate of shoot growth, which produces more cuttings.
